# GSM FILE SERVER SCRIPT

Website Overview, Features, Requirements & Setup Guide

GSM File Server Script is a web-based digital product store concept for businesses that provide mobile-service resources and downloadable files. Depending on the script, customers may browse product categories, view product information, place orders, and access files made available to them after purchase.

## 1. Project Overview

The website can be used by GSM file providers, mobile repair shops, firmware sellers, and digital download businesses. It provides a central place to present digital products and manage store content. The exact functions depend on the selected script version, license, installed modules, and server configuration.

## 2. Main Website Features

| Feature | Purpose |
|---|---|
| Homepage & Navigation | Present the store, product sections, categories, and important links. |
| Product Categories | Organize firmware, tools, drivers, and other downloadable resources. |
| Product Search | Help visitors find products by keyword or category, if supported. |
| Product Details | Display product names, descriptions, images, versions, and prices. |
| Customer Accounts | Allow customers to register, sign in, and view account information, if enabled. |
| Cart & Checkout | Support the purchase process where included in the script. |
| Payment Integration | Connect supported payment providers using the store owner's own account. |
| Download Management | Provide access to authorized digital files according to the script's controls. |
| Featured & Best Sellers | Highlight selected products and popular items, if supported. |
| Responsive Layout | Make the website usable on desktop, tablet, and mobile screens. |

## 3. Types of Digital Products

• Mobile firmware and stock ROM files

• Android flash files and device resources

• Mobile USB drivers and utilities

• Mobile servicing tools and software

• Repair-related documents and guides

• Other lawful digital downloads

## 4. Admin Panel & Store Management

• Add, edit, and remove product listings

• Create and manage product categories

• Upload and organize digital files

• Update product descriptions, images, and prices

- Review customer accounts and orders
- Manage featured products and homepage content, if supported
- Configure store settings and supported payment options

## 5. Installation Requirements

- A registered domain name
- Web hosting or a VPS that meets the script's requirements
- A valid and authorized copy of the script
- Compatible PHP version and required PHP extensions
- MySQL or MariaDB database, as specified by the developer
- cPanel/WHM or server access with permission to install the website
- SSL certificate for HTTPS
- Payment provider account and API credentials, if online payments are required

## 6. General Installation Process

- Check the official script documentation and server compatibility.
- Prepare the domain, hosting account, and SSL certificate.
- Create a database and database user with the required permissions.
- Upload the script files and extract them into the correct website directory.
- Configure the database connection and application settings.
- Run the official installer or follow the developer's installation procedure.
- Configure store details, email settings, currency, and supported payment methods.
- Test product listings, customer flows, checkout, and download permissions.

## 7. Security & Maintenance

- Use strong, unique administrator passwords and enable HTTPS.
- Keep the script, PHP runtime, database, and server packages updated.
- Restrict access to private files and administrative areas.
- Maintain regular backups in a separate location and test restoration.
- Use secure methods to share temporary hosting credentials and change them afterward.
- Only distribute files that you own or are legally authorized to sell or share.

## 8. Pre-Launch Checklist

- Homepage, navigation, and categories load correctly.
- Product names, descriptions, images, and prices are accurate.
- Registration and login work, if enabled.
- Checkout and payment processing are tested safely before launch.
- Only eligible customers can access purchased downloads.
- HTTPS is active and the website works on mobile devices.
- Backups and administrator access have been checked.

## 9. Important Notes

This is general documentation for a GSM File Server website project. It is not a claim that every listed feature is included in a particular script. Confirm the exact features, PHP/database requirements, payment gateways, download controls, and installation steps with the script vendor's official documentation before purchase or deployment. Some functions may require additional modules, licenses, or custom development.
